

Rufunsa 2025 CDF

Kaggle Publication Guide

A standalone guide for publishing the CDF community-project dataset responsibly

1. Dataset to publish

Publish **db-unza26-csc4792-rufunsa_cdf_community_projects.csv** as the primary dataset. It contains 96 community-project submissions received from Ward Development Committees for the 2025 Constituency Development Fund cycle in Rufunsa, Lusaka Province, Zambia.

The records represent submissions received. They are not a list of approved, funded, or completed projects.

Recommended Kaggle metadata

Kaggle field	Recommended value
Title	Rufunsa 2025 CDF Community Project Submissions
Subtitle	Ward Development Committee submissions for the 2025 CDF cycle
Format	Pipe-delimited CSV (use as the separator)
Geography	Rufunsa District, Lusaka Province, Zambia
Suggested tags	zambia; public-sector; local-government; community-development; open-data; infrastructure
Update expectation	No scheduled update; identify the retrieval date and source document version

2. Ready-to-paste Kaggle description

This dataset contains 96 community-project submissions received from Ward Development Committees for the 2025 Constituency Development Fund cycle in Rufunsa, Lusaka Province, Zambia. It was transformed from an official Rufunsa Town Council workbook. The dataset preserves the source URL, source document title, and retrieval date for provenance. It represents submissions received and should not be interpreted as a list of approved, funded, or completed projects.

3. Files and upload order

- **Required:** db-unza26-csc4792-rufunsa_cdf_community_projects.csv - primary tabular dataset.
- **Recommended:** rufunsa_sources.csv - source inventory and provenance context.
- **Optional:** rufunsa_cdf_links.csv - filtered catalogue of related CDF publications.
- **Optional with a clear warning:** db-unza26-csc4792-rufunsa_idp_projects.csv. Label it as a raw IDP PDF table extract, not a curated IDP-project dataset.

Do not upload the original PDFs or Excel workbooks until their reuse terms and any personal-data implications have been reviewed.

4. Data dictionary

Field group	Fields	Use
Project identity	project_id, project_name, project_description, project_type	Identify and describe the proposed project
Location	ward, zone, council, province, district, constituency	Map or aggregate by location
Classification	sector, project_type	Analyse project focus
Reach	beneficiaries	Reported beneficiary value; clean before numeric aggregation
Application checks	cdf_application_form_yes_no, wdec_recommendation_yes_no, wdc_minutes_yes_no, zonal_minutes_yes_no	Reported supporting documents
Provenance	financial_year, source_url, source_document, retrieval_date	Trace the originating publication

5. Data-quality note for users

- Clean leading and trailing spaces in ward, sector, and project_type before grouping. For example, the raw values include both Chitimbwi and Chitimbwi with trailing whitespace.
- Keep beneficiaries as text in the original data. It includes numeric values as well as blanks, nill/Nil, and text such as 12 households.
- The source labels vary in wording. Report cleaning rules and retain the raw columns when publishing derivative analyses.
- Kaggle analyses should not infer approval, funding, completion, or cost unless those fields are independently sourced.

6. Kaggle notebook starter

```
import pandas as pd

cdf = pd.read_csv(
    "/kaggle/input/rufunsa-2025-cdf-community-project-submissions/"
    "db-unza26-csc4792-rufunsa_cdf_community_projects.csv",
    sep="|"
)

for col in ["ward", "sector", "project_type"]:
    cdf[col] = cdf[col].astype("string").str.strip()

cdf["beneficiaries_numeric"] = pd.to_numeric(
    cdf["beneficiaries"], errors="coerce"
)

projects_by_sector = cdf["sector"].value_counts(dropna=False)
projects_by_ward = cdf["ward"].value_counts(dropna=False)
```

7. Citation and source

Rufunsa Town Council. (2025). *2025 CDF Projects Received from WDCs* [Excel workbook]. Retrieved through the Rufunsa Town Council CDF page. Processed in the CSC4792 Rufunsa project.

Cite the source_url and retrieval_date stored in the dataset whenever you reproduce, compare, or extend an analysis.
